

Sveltia CMS — Content Management Guide

ServiceLinePro uses **Sveltia CMS**, a lightweight Git-based content management system. All content changes are saved as commits directly to the GitHub repository.

Accessing the CMS

1. Navigate to <https://servicelinepro.com/admin/> (<https://servicelinepro.com/admin/>)
2. Click **“Login with Netlify Identity”** (or the OAuth provider configured).
3. Authenticate with your authorized GitHub account.
4. You’ll be taken to the CMS dashboard.

First-time setup: An admin must invite your email via the Netlify Identity panel (or the configured auth provider) before you can log in.

Content Collections

The CMS provides editors for the following collections:

Collection	Description	Folder
Case Studies	Client success stories with before/after metrics	<code>src/content/case_studies/</code>
Blog Posts	Articles, guides, and news	<code>src/content/blog_posts/</code>
Industry Pages	SEO-optimized pages per industry (HVAC, Plumbing, etc.)	<code>src/content/industry_pages/</code>
Location Pages	City/region landing pages for local SEO	<code>src/content/location_pages/</code>
Team Members	Staff bios and photos	<code>src/content/team_members/</code>

Creating / Editing Content

1. In the CMS sidebar, select a collection (e.g., **Blog Posts**).
2. Click **“New Blog Post”** (or open an existing entry).
3. Fill in the required fields:
 - **Title** — Page heading
 - **Slug** — URL-friendly identifier (auto-generated from title)
 - **Body** — Main content (Markdown editor with rich text toolbar)

- **SEO Title / SEO Description** — For search engine metadata
- **Featured Image** — Upload or select from the media library
- **Draft** — Toggle ON to keep the post hidden from the live site

4. Click **“Publish”** (or **“Save”** for drafts).

Publishing creates a Git commit on the `main` branch. Cloudflare Pages will automatically rebuild and deploy within ~60 seconds.

Media / Images

- Upload images via the **Media** section in the CMS or inline within any image field.
- Images are stored in `public/images/uploads/`.
- Use descriptive filenames (e.g., `hvac-case-study-results.jpg`) for SEO benefit.
- Recommended formats: WebP or optimized JPEG/PNG.

Tips

- **Preview before publishing:** Use the CMS preview pane to see how content will look.
- **SEO fields matter:** Always fill in `seo_title` and `seo_description` — these directly control how the page appears in Google.
- **Draft mode:** Use the Draft toggle to work on content without it going live.
- **Undo mistakes:** Since every change is a Git commit, you can revert any change via the GitHub repository history.

Troubleshooting

Issue	Solution
Can't log in	Ensure your email has been invited via Netlify Identity / OAuth provider
Changes not appearing	Wait 60-90 seconds for Cloudflare Pages to re-build; check the deploy status in the Cloudflare dashboard
Image upload fails	Check file size (keep under 5 MB); ensure filename has no special characters
CMS loads blank page	Clear browser cache and try again; check browser console for errors
